App Title: TrackNFix: Digital Maintenance Record Tracker

Problem Statement: Keeping track of repairs and maintenance for cars, appliances, or homes can be challenging, as people often rely on memory, scattered receipts, or messy notes. Because of this, it's easy to forget important maintenance schedules or overlook small repairs, which can lead to repeated fixes, higher costs, or even damage to the asset. Most existing apps only provide reminders or simple notes, without showing the full history, costs, or trends. This makes managing personal or household assets more difficult than it should be. There is a clear need for a user-friendly app that organizes maintenance records, tracks expenses, and helps users plan future repairs efficiently.

Proposed Solution: To address the challenges of tracking repairs and maintenance, this study proposes the development of a mobile application called "TrackNFix". The app will allow users to log maintenance activities, upload receipts, and set reminders for upcoming repairs. It will also track costs, organize repair history in a timeline, and provide insights on spending and service patterns. By centralizing all maintenance records in one place, users can plan repairs efficiently, avoid repeated expenses, and extend the lifespan of their assets. This solution provides a simple, user-friendly, and practical tool for managing personal and household assets.

Target Users

- **Homeowners / Renters**

Individuals responsible for managing household assets such as appliances, furniture, or home systems, who need an organized way to track repairs, maintenance schedules, and associated costs.

- **Vehicle Owners**

Car and motorcycle owners who want to monitor service history, schedule regular maintenance, and avoid unnecessary repairs or expenses.

- **Small Business Operators**

Owners of small businesses who maintain office equipment, tools, or vehicles, and require a centralized system to manage repair records, track costs, and plan future maintenance efficiently.

App Goals and Objectives

Goal: The goal of TrackNFix is to provide a user-friendly mobile application that allows individuals to efficiently track, organize, and manage the maintenance and repair history of their personal and household assets, helping users save time, reduce costs, and extend the lifespan of their belongings.

Objectives:

- To allow users to log maintenance and repair activities for various assets, including cars, appliances, and home equipment.
- To enable users to upload receipts, notes, and details related to each repair or service for future reference.
- To provide reminders for upcoming maintenance schedules to prevent missed services and reduce unnecessary repairs.
- To generate analytics and visual timelines that show repair history, spending trends, and service patterns.
- To create a centralized, organized, and easily accessible platform for managing asset maintenance efficiently.

Originality Statement

While apps like AUTOsist, Equipt, and ServiceLog already offer maintenance tracking, reminders, and repair history for vehicles or equipment, they mostly focus on specific assets or business needs. TrackNFix is different because it provides an easy-to-use solution for all kinds of personal assets, including cost tracking, timeline organization, and maintenance insights. This proposal presents the concept, objectives, and potential benefits of the app, highlighting its value for everyday users who want to manage their assets efficiently. I believe that implementing this app will help users save time, reduce unnecessary expenses, and maintain their belongings more effectively.
